FOREWORD

This report presents the various public employment data available at the OECD and explains differences among sources. Using this set of data, the authors propose an assessment of public employment for various areas of the public sector, all comparable across countries.

This survey was prepared by Nicole Lanfranchi and Hélène Perrin, and technical assistance was provided by Karim Courty and Kathie Poinsard of the OECD Public Management Service.

Any errors or omissions of fact or interpretation are purely the responsibility of the Secretariat and do not commit the governments of OECD Member countries. This document is published on the responsibility of the Secretary-General of the OECD.
I. Background

Introduction

Associated with public management reform are whole series of questions about the public sector, its relative importance within the economy, its definition and its performance. Sooner or later, all these questions inevitably focus on “the size of the public sector”. Similarly, whenever major problems such as the volume of public expenditure, privatisation, the various legal forms of providers of public goods and services, citizens’ needs or pay determination are analysed, it is rare that studies fail to allude to “the volume of public employment” for the purpose of making comparisons between countries. Public employment becomes the common denominator by which the experience of the various OECD countries can be assessed, and it gives an idea of the magnitude of the task accomplished and the results obtained. When seen in relation to aggregate public employment, the scope of many of the changes that have taken place in public management becomes more tangible and more readily open to international comparisons.

The inadequacy of comparisons among countries

In contrast to employment in the private sector, public employment has not been covered by special surveys or publications that have been harmonised between countries. Most of the time, the figures used for international comparisons are a compilation of data from a number of different sources. In many cases, there is a wide variety of sources - some overlapping, all addressing specific needs. As a rule, administrative sources tend to be geared to personnel management concerns, and they are invaluable for assessing the cost of a measure. Another type of information is provided by general statistical sources (population censuses, household surveys, etc.). In all likelihood, these sources are more appropriate for making comparisons and computing various indicators; inter alia, they can be used to relate public employment to employment as a whole. The problem with this type of general information is one of aggregating the various sources and using them in combination with other sources in order to obtain similar data from both the public and private sectors.

At the national level, there have been few attempts to compare figures and methods so as to cover general government in its entirety. There may be even fewer as administration and decision-making become increasingly decentralised. Decentralisation has spawned new government agencies that think in terms of performance, cost-effectiveness and their own particular needs. Within each agency, the workforce is managed so as to optimise value for money. This dispersal of personnel administration obviates the need for broader statistics in order to manage human resources or assess a measure’s cost. Even so, the need for a comprehensive estimate of the results of public management reform, and for comparing the volume of national public employment to other aggregates, is still there, as is the need to monitor the public employment market and to make international comparisons.

1. The OECD’s National Accounts series provide little breakdown of general government employment. The system of National Accounts (SNA) uses a financial criterion to define the scope of general government, which could potentially introduce distortions between countries, e.g. when public enterprises are under the government’s direct financial control.
Problems with concepts

Difficulties of definition

The scope of the public sector can be defined in a variety of ways. One option is to reason in terms of the status of employees. This criterion is satisfactory in some countries, in which the vast majority of government workers are civil servants. But this is not the most widespread case - quite the contrary, since the trend in many OECD countries is to recruit staff on fixed-term (i.e. non-civil service) contracts. Even so, civil servants or not, a distinction can be made between personnel subject to public law and those subject to private law, and especially those covered by industry- or company-wide collective agreements. But the far-reaching changes that have affected public services since the late 1980s will probably make that distinction inoperative in more and more countries. This is already the case in New Zealand, for example, where all salaried workers in both the public and private sectors are subject to the same labor legislation (the Employment Contracts Act 1991).

To define the scope of the public sector on the basis of the employer’s identity would seem more satisfactory than the previous criterion. Moreover, the employer’s identity is the criterion used by the OECD Public Management Service in its work on Public Sector Pay Trends. As part of that activity, wage bill trends are analysed in parallel with trends in the “corresponding” employment (i.e. personnel paid directly by the public authorities). This approach, which is warranted for strict analysis of pay bill trends, shows its limitations as soon as there is any intention of comparing the volume of public employment from one country to another. The first difficulty stems from the diverse ways of financing public expenditure between the central government, regions, provinces and municipalities, and, in some cases, between a federal government and states. Accordingly, if the chosen criteria is “who pays?”, then, in the case of the National Health Service (NHS) in the United Kingdom, employees of NHS Trusts - health service provider units that have opted to change their status, and which now operate with independent financing arrangements -should not be counted. The difficulty is then compounded by the fact that NHS Trust employees hired before their employer’s change of status can opt to retain their previous contract of employment. In that case, their conditions of employment and compensation are set at the national level by Pay Review Bodies and not locally by their employer.

Another difficulty tied in with the distinction between payer and employer arises when salaries are paid out of State grants. This is the case for teachers and health care workers in a great many countries.

Difficulties of measurement

The measurement of salaried employment in full-time equivalent terms takes a certain type of job as the standard unit and expresses all other types as fractions of that unit of account. However, the standard unit varies from one country to another, in particular because the treatment of part-time work can be based either on how workers perceive it or on a threshold corresponding to a number of hours normally or effectively worked. Whatever the rule for converting part-time employment to full-time equivalent - it is often assumed that a part-time position represents half of a full time equivalent - second jobs are not taken into account.

---

2. This system of classification is inspired by the work presented in a report (Dispositif statistique sur les trois fonctions publiques) by the French Conseil National de l’Information Statistique on statistical reporting systems in civil service.
Because employees do not necessarily work for twelve consecutive months (i.e. for a full calendar or financial year), it is necessary to reason in terms of work years. Like that of full-time equivalent, the definition of a work year varies from one country to the next. Some statistics count workers who are present all year round, while others specify a minimum number of months. It can also be the case that full-time workers present for only part of the year are counted proportionally to their presence when the yearly average is computed. As a rule, employment statistics tend to be structured as follows:

<table>
<thead>
<tr>
<th>Number of employees</th>
<th>Actual worktime (in weeks)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Total number of employees = $E$</td>
<td>$W$</td>
</tr>
<tr>
<td>All-year employees = $E_1$, of which:</td>
<td></td>
</tr>
<tr>
<td>• full-time employees = $E_{11}$</td>
<td>$W_{11}$</td>
</tr>
<tr>
<td>• part-time employees = $E_{12}$</td>
<td>$W_{12}$</td>
</tr>
<tr>
<td>Part-year employees = $E_2$, of which:</td>
<td></td>
</tr>
<tr>
<td>• full-time employees = $E_{21}$</td>
<td>$W_{21}$</td>
</tr>
<tr>
<td>• part-time employees = $E_{22}$</td>
<td>$W_{22}$</td>
</tr>
</tbody>
</table>

Average annual employment can be calculated as follows:

$$E(\text{av}) = \frac{E\cdot W}{52}$$

where

$$E = \frac{(E_{11}\cdot W_{11} + E_{21}\cdot W_{21})}{52}$$

In full-time equivalent, it can be expressed as follows:

$$E(\text{fte}) = \left[\frac{E_{11}\cdot W_{11} + E_{21}\cdot W_{21} + t(E_{12}\cdot W_{12} + E_{22}\cdot W_{22})}{52}\right]$$

$t$ = percentage of part-time employment in total employment.

From this definition, it can be seen that the average annual number of employees, the total number of employees and the number of full-time equivalent employees lead to very different orders of magnitude, especially in countries where part-time work is widespread. The various definitions of the concept of employment used to produce statistics on public employees require the utmost vigilance if comparisons are to be made among countries.

**Purpose of this work**

The purpose of this work is to present figures that are comparable among countries. Given the limitations arising from the problems raised above, one solution is to establish spheres of comparability of increasing scope among countries. Three spheres were selected, each corresponding to a given scope, ranging from the most restrictive to the most extensive:

- First level of comparison: Central or Federal Government [C];
- Second level of comparison:

Restricted public sector [R] = [C] + regional or state governments + local governments + municipalities;
- Third level of comparison:
Extended public sector \([E] = [R] + \text{public enterprises}\).

In proceeding in this manner, a minimum level of comparison - that of central government \([C]\) - is ensured for all of the 23 countries examined. The second and third levels \([R]\) and \([E]\) are documented when available, the objective being to attain the maximum degree of comparability (i.e. the most extensive scope) for the largest number of countries.

For each country, the framework adopted for presenting information is identical:

- international comparisons available;
- explanations of differences between sources;
- identification of national sources;
- establishment of spheres of increasing scope, comparable among countries.

To conclude, it was deemed useful to indicate public employment’s share in aggregate employment, despite the blurry boundaries between the public and private sectors in many countries.

---

### Public employment statistics produced by the OECD

#### I. Annual National Accounts

Producers of services delivered by general government constitute a separate category within total employment. They can be found under the heading: “Employees of producers of government services”.

**Scope**

The heading “Producers of government services” encompasses all ministries, agencies and other services of (central and local) government, social security systems serving large segments of the community which are taxed, controlled or financed by government, non-profit institutions financed fully or primarily by government or controlled by government and those that primarily supply services to government, as well as embassies, consulates and military installations located abroad. Members of the armed forces are considered employees irrespective of the length or type of service they perform. Conscripts are therefore normally counted, but in fact not all countries count them, given the difficulty involved in estimating their numbers.

**Data collection**

Statistics are collected by the OECD, which updates the series on the basis of a questionnaire prepared by the United Nations and using SNA terminology. Responses are forwarded by the Member countries (National Statistical Offices), accompanied in some cases by explanatory notes. However, responses do not convey any information about sources or methods of calculation. The figures used are the ones furnished by the countries in question, with no changes. It should be noted that, since the priority of National Accounts is to report on financial flows, the collection of employment data is merely a by-product. It is for this reason that the comparability of public employment figures is less than perfect.

**Statistics produced**

The total volume of public employment is available in *National Accounts*, Volume 2, Detailed Tables.
II. OECD Analytical database (ADB)

This database provides public employment statistics under the heading: “Public Employment”.

Scope

Theoretically, the scope is the same as for National Accounts. In fact, results sometimes differ between the two sources. For ten countries (out of the 26 studied), ADB takes the results published in National Accounts. For the remaining countries, National Accounts figures do not seem accurately to reflect the true scope of the public sector, and they have been revised using input from additional sources.

Sources

Figures are taken from a variety of sources, including National Statistical Offices, Central Banks and administrative sources. Definitions are not uniform across countries, in terms of either scope or measurement. In some countries (Austria, Canada, Germany and New Zealand), public enterprises are included within the public sector. In some instances (France, Spain and Sweden), employees of the social security system are counted in the scope as defined by the national accounting system, whereas the status of these employees is similar to that of private sector workers. ADB provides little information about how employment is measured by each of the sources.

Statistics produced

The total volume of public employment given by ADB is used in preference to National Accounts data in certain OECD publications (such as OECD in Figures and Issues and Developments in Public Management, etc.

II. The PSPE/PUMA database

This database was set up to meet the needs of work on Public Sector Pay Trends. It collects statistics on wages, pay bill volume and corresponding employment in the public sector.

Scope

Public enterprises, irrespective of the extent of the State’s financial interests, are excluded from the scope of the public sector. To the fullest possible extent, the survey counts employees in full-time equivalent (as calculated by each country).

Sources

Most of the information comes from administrative sources, and some comes from National Statistical Offices. The difficulty here is to ascertain the number of employees corresponding exactly to governments’ expenditure on personnel. For this reason, preference is given to administrative sources, which are theoretically able to provide both the volume of the pay bill and the number of employees corresponding to that expenditure. Some countries have surveys covering earnings and employment in the entire economy, making it possible to obtain good quality statistics suitable for comparisons with pay levels in the private sector.

Statistics produced

This database gives a breakdown by level of government (central or federal, regional or state, and local) and/or by functional sub-sectors. The advantage of the PSPE database is, in fact, to provide information that is more detailed than what is presented in either of the two databases mentioned above.

Other publications

Until 1995, the Public Management Service published an annual report on public management developments, supplying employment statistics per country. These statistics did not strive for comparability, and in fact reflected each country’s image of the scope of its own public sector.
II. Public employment according to the different OECD sources

**Measurement**: number of salary earners. | National publication | 1 546 000 |

Comments

The ADB and PSPE databases and the publication National Accounts all use the same national source, but their coverage differs. National Accounts uses a relatively restricted scope, which corresponds to the heading “Administration and Defence” of the Australian Standard Industrial Classification (ASIC). The scope of PSPE and ADB corresponds to general government (i.e. the public sector in the restricted sense, as defined herein).

National definitions

The Australian Bureau of Statistics (ABS) proposes three approaches to the public sector:

- A breakdown by level of government: 1) Commonwealth; 2) State; 3) Local;
- A breakdown by type of institution: 1) General government; 2) Government trading enterprises; 3) Public financial enterprises;
- A breakdown by type of activity. At first glance, this nomenclature does not correspond exactly to our needs, because the public administration and defence sector covers only a limited portion of the civil service. However, a large portion of public employees are counted in the “community services” and “recreation, personal and other services” sectors.
These three conceptions of the public sector are presented in a single publication (Employed Wage and Salary Earners) and are derived from the Survey of Employment and Earnings. From the survey results it is possible to recap Australian public sector employees in a three-by-three matrix.

**Reminder of the ABS’s definitions** (Australian Bureau of Statistics, Employed Wage and Salary Earners):

- **General government**: public sector administrations mainly engaged in the production of goods and services outside the normal market mechanisms providing these goods and services to the general public. The costs of operations are often financed from public revenues.

- **Public trading enterprises**: public sector enterprises predominantly engaged in the production of goods and services with an intention of maximising profits and financial returns with most operating costs being derived from trading activities.

- **Public financial enterprises**: public sector enterprises actively involved in financial market transactions such as borrowing and lending. Excluded are those public bodies whose funds flow directly to or from general government revenue.

</tr>
</tbody>
</table>

### Comments

The scope used by ADB includes public enterprises and therefore corresponds to the extended public sector, whereas the scope used by PSPE corresponds to the restricted public sector. Vienna is put in a separate category, because it is both a municipality and a *Land*. This special status of the city of Vienna constitutes a source of potential error in that it can lead to double counting.

National Accounts includes private non-profit-making services; however, under the system of national accounting, these services are not included in the scope of general government. The difference between ADB and National Accounts therefore stems from the fact that 1) ADB includes
public enterprises but National Accounts does not; and 2) National Accounts includes private non-profit-making services (but ADB does not).

**National definitions**

- Social security offices and agencies have public enterprise status and are independent.
- Since 1994, the railway system (about 66 000 persons) has no longer been part of the federal government.

<td>1 009 018</td>
</tr>
</tbody>
</table>

Comments

The statistics provided by the General Administration Service (SAG) are furnished by the personnel units of the respective departments, except for provincial and local administration. SAG defines the scope of the public sector as a specific list of institutions.

The ONSS counts the number of workers affiliated to social security (an individual performing different jobs for two separate employers would be counted twice) and divides the aggregate work force into public employment and private employment. The scope of the public sector used by ONSS is very extensive, and it includes a portion of the private sector (e.g. self-employed teachers and employees of the airline Sabena).

National definitions

As defined by the General Administration Service of the Ministry of Home Affairs and Civil Service, the public sector comprises:

- the Federal Civil Service, which in turn is made up of federal departments, federal scientific bodies, some federal public utility bodies and special corporations;
- non-federal public services, including communities and regions, provincial and local administrations and legislative bodies;

- public utility bodies not belonging to the federal civil service, autonomous public enterprises and public financial institutions.

</tr>
</tbody>
</table>

### Comments

Statistics Canada has two surveys covering the public sector: the Public Institution Division Database (PID) is specific to the public sector, whereas the Survey on Employment Payrolls and Hours (SEPH) covers both the public and private sectors. Various definitions of the scope of the public sector co-exist in Canada, each corresponding to separate needs. This explains the substantial divergence between the OECD’s two main sources - ADB and National Accounts. The figure used by National Accounts would seem underestimated in that it includes only the public
administration component of the public sector. In contrast, the ADB figure seems overestimated, especially since it does not include military forces.

National definitions

Reminder of the PID’s definition:

- Canada’s public sector comprises all entities subsidiary to a public agency, whether they are commercial or not. The public sector is divided into two parts: government (the notion being identical to the SNA concept of general government and including the armed forces) and public enterprises.

- The Government or State public sector comprises ministries, agencies, councils, commissions, municipalities and funds established and controlled by governments, public educational institutions, cultural facilities, hospitals, social service agencies and agencies administering universal pension systems.

- Public enterprises are entities that conduct commercial transactions. Their motivation is similar to that of private sector enterprises, but they are controlled by a level of government. They compete with private sector enterprises in the same industry, or they hold natural monopolies.

- Social Security systems (Pension Plans Canada and the Régie des rentes du Québec) are included, respectively, in the federal government and the Quebec provincial government.

Reminder of the SEPH’s definition:

Public administration contains only the establishments engaged in activities that are governmental in character and those serving as internal service agencies of the public service. Government-owned establishments primarily engaged in activities assigned to other activities such as health and education services and transportation and communication services are classified to the appropriate industries. SEPH does not publish defence services and includes civilian defence workers in federal administration. SEPH publishes public administration data that do not represent all employees of non-commercial entities under the control of a government.

<td>ii) full-time employment only.</td>
<td></td>
<td>(full-time)</td>
</tr>
</tbody>
</table>

**Comments**

The various sources do not use the same unit of measurement, which is part of the reason for the discrepancies. Unlike some other countries (such as France or Germany), Denmark includes the Danish State Railways in central government. It should be noted that there are also private railways in Denmark.

The cities of Copenhagen and Frederiksberg have dual status, inasmuch as they each constitute both a municipality and a county, and are counted separately in certain sources.

In 1995, the status of the postal service was converted from civil service to that of a public enterprise.

Military personnel, who are not included in the scope used by ADB, number approximately 30 000.

</tbody>
</table>

**Comments**

State and municipal public enterprises are part of the extended public sector. In contrast, employees of joint stock companies belonging to the central or municipal governments are included in private employment statistics.

Municipal public enterprises are included in the scope chosen by PSPE, since statistics on their employees are not available separately. Nevertheless, an estimate was made for the purposes of the diagram below.

Comments

Because French national accounting makes no distinctions among producers of non-market services, the scope of general government as derived from the national accounts includes all such producers and differs from the SNA definition, which distinguishes between producers of government services and other producers. As a result, the number of employees presented in the SNA/OECD database is significantly overestimated.

One of the characteristics of French public employment statistics is the need to tap a number of separate surveys in order to obtain a figure for aggregate general government employment. Because of this, a measurement problem arises, since some sources (and particularly those at central level) report on number of full-time permanent posts scheduled by the Budget; other sources present actual employment (i.e. every part-time job is accounted for a unit).
The National Statistical Office (INSEE) carries out a number of surveys covering various portions of the public sector:

1. “Civil Servants” (*Agents de l’État*): an annual publication, generated from payroll registers of the Ministry for the Civil Service. In addition to the national civil service, the scope includes national public establishments and Post and Telecommunications but excludes public enterprises. Information on employees is extremely detailed (categories of staff, status, hierarchical levels, age, geographical breakdown, etc.). Employees are reported on a full-time, part-time and full-time equivalent basis.

2. Annual survey of employees in regional and local administration. The scope of this survey comprises regional authorities in the strict sense of the term (including regions, localities and municipalities), public establishments of municipalities (e.g. garbage collection) and localities (e.g. fire-fighting) and a number of other agencies. Employees are reported on a full-time, part-time and full-time equivalent basis.

3. Each year there is a survey that can be used to identify French public enterprises (enterprises that are State-controlled, either directly or indirectly). The results of this survey are available in the report on majority-owned State enterprises (*Répertoire des entreprises contrôlées majoritairement par l’État*).

The number of national health service employees is known from surveys conducted by the Ministry of Social Affairs. One annual survey focuses on all public health care bodies, while other questionnaires cover independent units of the national health service.

**National definitions**

*The scope of general government under French national accounting*

In the French system of national accounting, general government comprises three sub-sectors:

- central government;
- local administration;
- social security system.

Each of these three sub-sectors is subdivided into two parts: direct departments, and agencies subsidiary thereto. Excluded are: the postal service, the *Office National des Forêts* (ONF, which is included in the non-financial enterprise sector) and the *Caisse des Dépôts et Consignations* (CDC, included in the credit institution sector). In contrast, the scope includes: social security agencies (whereas only national funds are part of the civil service), private schools under contract, private hospitals taking part in the national health service and private agencies financed with a majority of public funds.

**The public sector in the conventional sense**

- *State Civil Service*: central government agencies and related agencies located in regions as well as public administrative establishments subsidiary thereto;
- *Regional civil service*: regions, localities, municipalities;
• **National health service:** public hospitals and public retirement homes;

• **Public enterprises:** any enterprise over which the government can exercise a dominant influence, either directly or indirectly, via ownership or financial investment, possessing a majority of shares or voting rights. This excludes firms in which the central government and local authorities jointly hold majority interests.

### Comments

The country’s reunification caused a break in the series in 1991. Some sources (and publications) chose to retain the old series and not to incorporate the new Länder, whereas other sources integrated them.

The series used by National Accounts and ADB is taken from the table “Number of employees by type of industry”.

The figures given in the publication “Finances and Taxes” are drawn from an administrative source, “Public Finance and Civil Service Personnel Statistics”. In this case, the public sector combines the direct and indirect public sector. The PSPE database includes only that portion of the public sector corresponding to general government (at the federal, Land and municipal levels).

Since 1991, the postal service (about 600 000 persons) has no longer been included in the scope of the public sector as defined by the Federal Statistical Office in the publication “Finances and Taxes”.

National definitions

Civil service personnel statistics make a distinction between:

- the *direct public service*, corresponding to the civil service and encompassing all employees of the federal, *Land* and municipal administrations, special municipal associations and the German Federal Railway; and,

- the *indirect public service*, comprising agencies and institutions set up as enterprises, governed by public law (Federal Employment Office, German central bank, social security agencies controlled by the government or the *Länder*, and authorities responsible for supplying the federal government - *der Länder und Träger der Zusatzversorgung von Bund*), regional and communal associations as well as legally independent institutions (*Ländern und Gemeindeverbänden und rechtlich selbständige Anstalten*) and legal entities and independent foundations governed by public law (*Körperschaften und Stiftungen des öffentlichen Rechts mit Dienstherrnfähigkeit*).

### Comments

In its definition of the public sector, the Department of Finance includes commercial State-sponsored bodies but excludes the judiciary and parliament.

The figures supplied to ADB by the Central Statistics Office exclude commercial public enterprises, pursuant to the National Accounts definition. In addition, employees of voluntary hospitals and voluntary secondary and third-level education are probably not taken into account. According to the Department of Finance, it is important that these workers be counted so as not to underestimate the share of education and health care in the public sector.

### National definitions

**Reminder of National Statistical Office’s definitions:**

- *The public service* includes the Ministries and State Offices, the State industrial employees, police, defence forces, education, health and local authorities;

- *The commercial State bodies* are state-sponsored bodies. They include the national electricity, telecommunications, postal, airlines, air navigation, television and radio companies.

Both public service and commercial state bodies make up the public sector.
• *The voluntary hospitals* are funded, wholly or partially, by grants by the Department of Health but which are not controlled by the Department. The vast majority of these hospitals are religious in origin and remain in private hands. However they are funded by the State as they accept public patients.

• *The secondary schools* are similar to the voluntary hospitals and educate pupils between the ages of 12 to 18 years.

• *The universities* are funded by the State but have their own governing bodies.

The National Statistical Office provides a detailed breakdown of the public sector:

### Comments

The series furnished by SNA and ADB are similar, and not very different from those used by PSPE. Based on the Labor Force Survey, ISTAT provides statistics using a variety of classification systems. *Inter alia*, National Accounts uses a definition of the public sector that complies with the SNA classification (excluding public enterprises, the electric company, autonomous public enterprises, the postal and telecommunications service, the railways and any agency that sells services to the public).
A breakdown of public employment by type of institution (see below) is also available.

The administrative source (*Ragioneria Generale dello Stato*) gives breakdowns by:

1. activity (ministries, autonomous bodies, schools, universities, police, armed forces, judges, diplomats);
2. category (judges, managers and related occupations, teachers and researchers, operatives);
3. sex.

**National definitions**

The Italian public sector encompasses the following three concepts:

- **General government**, comprising the government and other agencies of the central administration, an autonomous body (the forestry office), hospitals and social security institutions, and other local and central agencies.

- **Public enterprises**, including public agencies with autonomous financial status (postal services, local public services such as gas, water, household waste removal, local transport, etc.) and joint stock companies (electricity, railways, salt and tobacco).

- **State-controlled enterprises**, some of which produce public services such as telecommunications and air transport. Such enterprises are considered by National Accounts as belonging to the private sector. Since 1992, some of these enterprises have been converted to public enterprises as a prelude to privatisation.

The State’s presence in a number of industrial and commercial sectors - e.g. the three economic bodies, IRI, ENI and EFIM, in which the State has financial interests and which operate industrial and service enterprises—stems from historical factors. After the second world war, the government wished to intervene in the national economy, and to support employment levels in particular.

**Comments**

Except in the figure supplied by the national accounts, employees of social security bodies (civil servants or the equivalent) are always included.

Statistics for municipalities, provinces and intercommunal associations always include public enterprises (e.g. transport and electric companies). It is not possible to separate them. Data for municipalities, provinces and *Polder* Boards are collected by the National Statistics Office (CBS).

**National definitions**

The Netherlands public sector is made up of three distinct parts:

- The *general government* sector: employees of this sector include those whose conditions of employment are determined by collective bargaining with a governmental entity. Public enterprises are excluded, even if they are wholly owned by the State, because of their private legal...
status. Since 1993, the sector has been divided into eight sub-sectors (education, ministries, police, defence, the judiciary, municipalities, provinces and polder boards).

- The *nationally insured and subsidised (NIS)* sector: this includes agencies that are more than 50 per cent State-financed, along with a number of other agencies designated by law and largely dependent on subsidies and grants.

- *Public enterprises:* These can have either public or private legal status. They are majority (50 per cent or more) owned or controlled by public authorities, produce market goods and operate with private funds.

Under the Ministry of Home Affairs’ definition, the public sector is limited to general government and the NIS sector.

Comments

In Norway, a distinction is made between two different types of public enterprises, depending on their legal status:

- public enterprises belonging to central government (the railways and postal and telecommunications services);

- State-controlled enterprises that are legally independent entities and whose employees do not have civil servant status.

National definitions

- Employed persons in the statistical sense of national accounting are defined as the average annual number of persons involved in productive activities within Norway. Part-time and temporary workers are included. Persons on long-term unpaid leave are excluded, and persons holding employment in more than one sector are classified in the sector corresponding to their main employment.

**National definitions**

**Reminder of the definitions of the National Institute of Statistics:**

- **General government sector:** includes the central and local administrations.
- **Public sector:** includes central administration, local administrations, autonomous regions, public institutes and funds, public enterprises and public companies.
- **Central administration:** includes the government and the various ministries exercising direct State administration.
- **Local administration:** includes municipalities and surrounding areas. These municipalities have financial autonomy and are subject to administrative oversight.
- **Public enterprises and public companies:** include public enterprises and limited liability companies that are wholly or majority-owned by the State.

### Comments

Public employment statistics are provided by two main sources: the Central Staff Register of the Ministry of Public Administration and the Labor Force Survey of the National Statistical Office (INE). The two surveys have different coverage (the variation in scope being approximately 6 per cent) and provide different breakdowns. Both include social security, but divergent definitions of public enterprises provide a partial explanation for the difference in total employees (see National definitions, below).

The Labor Force Survey counts social security workers as a separate item, whereas the Central Staff Register attributes them to different levels of government.

In both cases, the surveys in question are quarterly.
National definitions

Reminder of the Central Staff Register’s definition:

- The general government sector is made up of institutional entities that administer or finance activities the primary purpose of which is to provide services, not intended for sale, to the general public and/or to redistribute income or national wealth, except for State commercial service enterprises and agencies operating primarily in the agri-food sector. The main resources of these entities consist of compulsory payments by entities belonging to other sectors and received either directly or indirectly. The sector includes personnel of the independent postal and telecommunications agency, and employees of social security services and of public enterprises run by central or autonomous community authorities.

Quarterly Labor Force Survey

- This survey is based on the International Standard Industrial Classification (ISIC), which uses the concepts of public administration, defence and compulsory social security. According to this survey, the public sector includes public enterprises (over 50 per cent State-owned) but excludes military personnel residing in barracks.

The figures below illustrate the results of the two surveys.

### National definitions

The *government sector* can be regarded as embracing:

- The *central government sector* carries out the following activities: infrastructure, employment service, health care and education, economy, social insurance offices, defence, culture, Church, regional administration offices, ministries and agencies staffs, environment, technology and agriculture, judicial and higher education and research. It also includes the commercial government enterprises: Post Office, State railways, Telecommunications, power supply, forest service, civil aviation, shipping and navigation boards.

- The *County Councils* embraces public health and transportation services.

- The *municipalities* are responsible for child care, care of elderly and social support, compulsory and upper secondary schools, water and sewage, etc.
State-owned companies competing with the private sector are not included in the government sector.

**Comments**

The ADB and SNA databases both use the national accounting figures published by the CSO. The differences between them stem from the fact that the SNA database takes longer to update.

At the beginning of each year, in its periodical *Economic Trends*, the Central Statistical Office publishes a complete report on public sector employment, including the figures presented below along with a set of corresponding definitions.
National definitions

Reminder of the “Economic Trends” definitions (Central Statistical Office):

- **The central government sector** can be regarded as embracing all bodies for whose activities a Minister of the Crown, or other responsible persons, is accountable to Parliament. It also includes a number of constituted bodies, which, while not government bodies in the ordinary sense, are financially dependent upon and effectively controlled in major matters by the government. (Regional and District Health Authorities of the National Health Service, National Research Councils, Royal Commissions, National Museums and Art Galleries). Also included are certain enterprises financed directly from the accounts of the government, such as the Forestry Commission and Remploy Ltd.

- **The local authorities** include all levels of administrative authorities and also authorities with special functions. It includes magistrates courts, the probation service in England and Wales and police forces and their civilian staffs. It embraces all functions of such authorities (including, for example, their education services and construction departments) and includes trading activities of local authorities, such as housing, theatres, etc. Most grant-maintained schools are regarded as part of the private sector.

- **Public Corporations** are public trading bodies which have substantial degrees of financial independence from central government. They are publicly controlled, directly or indirectly. Some public corporations are currently designated as “nationalised industries”.

- **Civil Service** comprises the Home Civil Service and the Diplomatic Service. Apart from some public corporations such as Royal Mint and HM Stationery Office the Civil Service is included in “Other Central Government”.

### Comments

The ADB and PSPE databases use the same source, the difference in results being due to how quickly the databases are updated.

The Census Bureau’s figures are expressed in full time equivalent, except in respect of the federal government, whose data are available only for full-time and part-time. Employment at the federal level...
on a full time equivalent basis could be estimated for 1994 at around 16.7 million, which is fairly close to the figure provided by National Accounts.

The concept of public enterprise does not exist in the United States. The United States Postal Service is the only agency that could be likened to such an enterprise, but its employees are presented in the official sources as a component of the federal government work force.

National definitions

Reminder of the Bureau of the Census definitions:

- **Federal Government**: the term federal encompasses all civilian employees of the U.S. Government, including the legislative and judicial branches and all departments and independent agencies of the executive branch. Excluded are the uniformed employees of the armed forces.

- **State governments**: This category refers to the governments of the 50 states which constitute the United States. The state government in each case consists of the legislative, executive and judicial branches of government and all departments, boards, commissions, institutions of higher education, and other organisational units. It also includes any semi-autonomous authorities, districts, and other agencies that are subject to administrative and fiscal control by the state through its appointment of officers, determination of budgets, approval of plans, and other devices.

- **Local governments**: The Bureau of the Census classifies local governments by five major types: county, municipal, township, school district, and special district.
Breakdown of employment in the public sector
